Vaccines Save Lives and Money – Vaccines are one of the greatest success stories in public health and are among the most cost-effective ways to prevent disease. Indeed, we know that for each dollar invested in the U.S. childhood immunization program, there are over ten dollars of societal savings and three dollars in direct medical savings. Moreover, childhood immunizations over the past twenty years have prevented 381 million illnesses, 855,000 deaths, and nearly $1.65 trillion in societal costs. In the 2017 – 2018 season alone, flu vaccination prevented an estimated 5.3 million illnesses. Maintaining high vaccination coverage is vital for preventing epidemics of diseases that cause preventable illness, disability and death.

Annual influenza epidemics are estimated to result in an average of 3.1 million hospitalized days and 31.4 million outpatient visits, while the direct health care burden of vaccine-preventable diseases in adults is estimated at $10 billion annually. During the 2017-2018 flu season, CDC received reports of 185 pediatric deaths. In 2018, there were 349 cases of measles (preliminary numbers as of December 29, 2018), with most cases coming from three outbreaks associated with travelers who brought measles back from abroad. Eighty-one people brought measles to the U.S from other countries in 2018. This is the greatest number of imported cases since measles was eliminated from the U.S. in 2000. CDC estimates that is can cost over $140,000 to contain each individual case of measles. This should serve as a wake-up call. Unfortunately, during the past decade, federal funding has not kept up with the need to support a robust national immunization program.

How the 317 Program Continues to Serve a Critical Role – Vaccines alone cannot protect a population. A strong immunization infrastructure is required to ensure that children, adolescents, and adults receive appropriate immunizations. By partnering at the local and state levels with healthcare providers in the public and private sectors, the program helps assure the implementation of effective and safe immunization practices to achieve high coverage, reduce disparities, and support infrastructure for essential activities.

The Vaccines for Children program, the primary source of federal vaccine purchase funding for children, relies upon the critical infrastructure and operations funded through the Section 317 program to effectively serve millions of children each year. The Section 317 program is the backbone of our nation’s public health infrastructure. It supports the science that informs our national immunization policy, provides a safety net to uninsured, low-income adults for vaccine purchases, monitors the safety of vaccines, educates providers, performs community outreach, and conducts surveillance, laboratory testing and epidemiology to respond

to disease outbreaks. During the 2015 measles outbreak, 317 funds supported local and state health departments in rapid response, public health communication, data gathering and diagnostics.

Professional Judgment - CDC developed a professional judgment budget estimate that would cover the costs of realizing the prevention opportunities that are in scope for Section 317, accounting for changes in the recommended vaccination schedules, and projecting changes to the immunization financing environment. Program operations include state, local, and national, and come to $658.6 million. Vaccine purchases include uninsured adults and time-sensitive public health needs, coming to $163.3 million. In sum, the FY 2017 professional judgment total adds up to over $821.9 million.
